CENTURION · SOVEREIGN AI BRAIN

Updating to Sovereign AI Brain 7.1.2

Every screen, in the language you chose — not just the buttons.

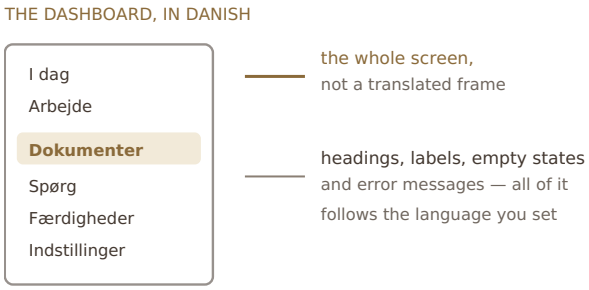

15 November 2026

What’s new

Twenty-four languages were in the picker. This release is the one where the screens behind the picker catch up with it.

The dashboard, all the way down

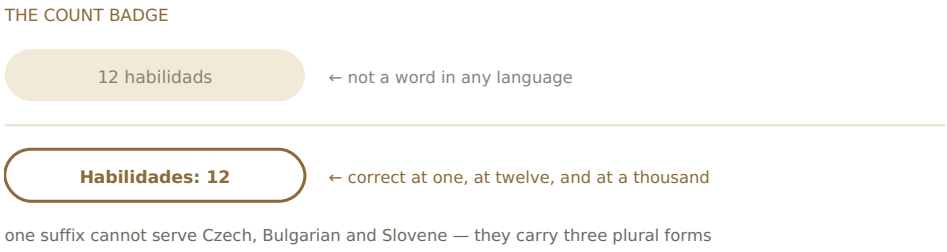

Every view — Today, Work, Documents, Ask, Skills, Settings — now carries its full translation in all twenty-four languages: headings, field labels, empty states and error messages, not only the menu and the buttons. Choose Dansk and the working screen is Danish.

Twenty-four languages, every screen. A reader in Copenhagen now meets *Dokumenter* and *Indstillinger* where he used to meet *Documents* and *Settings* in a Danish frame.

Counts that read properly

Small thing, visible every day. A count used to be written as a number glued to a suffix, which only works if your language forms plurals the way English does. Spanish came out as *“12 habilidads”*; Czech and Bulgarian would have been worse. The count is now labelled instead, which is correct at every number in every language.

Counts are labelled rather than suffixed, so they read properly whether the number is one, twelve or a thousand — in all twenty-four languages, not only the ones whose plural rules happen to match English.

Written, not guessed

Each of the twenty-four catalogues carries the same set of entries in the same order, and the build refuses to produce a bundle if even one is missing. A language that appears in the menu and then answers in English halfway down the page is worse than one that is honestly absent.

What this does not change

Your settings, your conversations, your Missions and your connections are untouched.

If English is your language, the visible change is one thing: the count badges now read “Skills: 24” rather than “24 Skills”. Nothing else on your screen moves. I would rather say that plainly than let a release note promise you a transformation you cannot see.

Code, file paths, tool names and commands are never translated, in any language. A translated command does not run.

How to update

1. Sign in and open **Account → Get Brain**. Your download sits at the top of the page.
2. Double-click the downloaded file and choose **Install**. Fedora may ask for your password — that prompt is your computer, not us.
3. **Reopen Sovereign AI Brain.** Your language is already set. Nothing else to run.

> **Check the download if you like.** The sha256 below is the exact file we published: `bb38d1402b0debe383a88752efeb0941774455196c6662a3463b43482b24e1fa` — about 99.7 MB.
>
> **Signed with Centurion’s release key.** No reboot is needed — reopening the Brain is enough.
